

BudgetAtlas

English User Guide

Version 1.1 - 29 August 2026

LOCAL BUDGET APP

BudgetAtlas is a responsive Progressive Web App for managing a monthly budget locally. Its dashboard brings buffer, expense ratio, Expense Mix, lists, and direct data tools together on desktop and mobile devices.

DESKTOP - DARK
Sidebar, compact cards, and two lists.

MOBILE - DARK
Bottom navigation and a vertical dashboard.

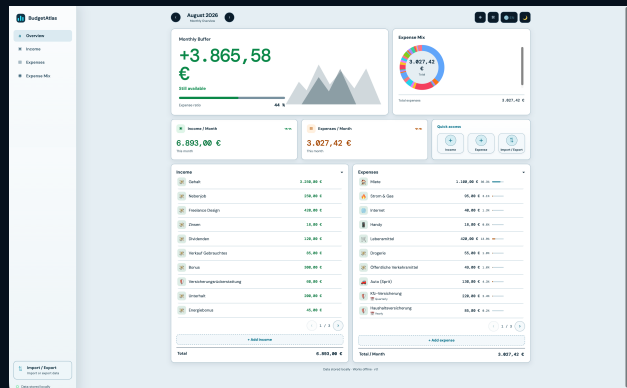

All displayed amounts, categories, and charts are fictional demo data from docs/examples/demo.xlsx in the public GitHub repository. They are not real financial data.

01 - Dark and light

The light view appears only here in this guide: as a direct theme comparison. Every later feature example uses the dark interface.

Desktop: dark theme

Desktop: light theme

Mobile: dark

Mobile: light

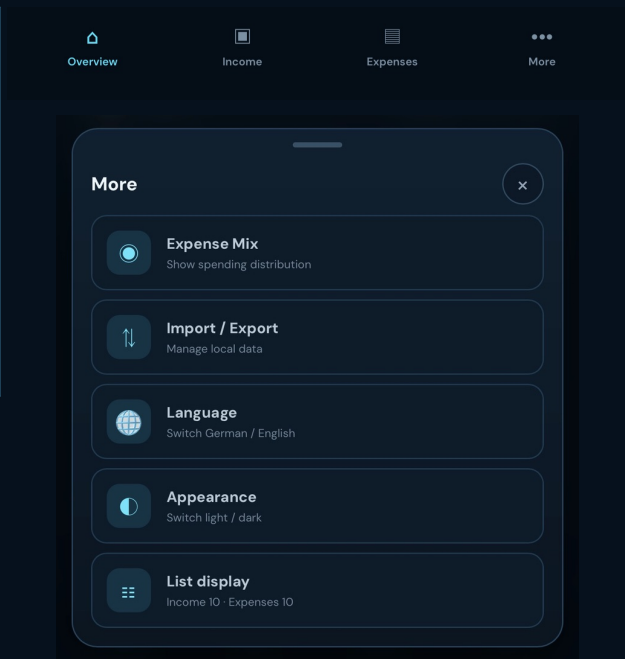

Change appearance: On desktop, the sun/moon button in the top right changes the theme. On mobile, open **More** and choose **Appearance**. Language and theme are stored locally.

02 - Navigation and getting started

DESKTOP

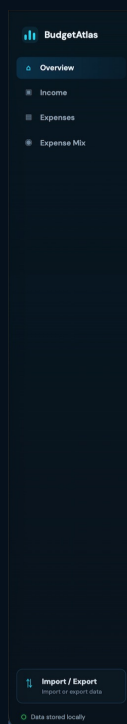

Desktop: The left sidebar leads to Overview, Income, Expenses, and Expense Mix. Import / Export sits at the bottom. The month header changes the displayed month with its arrows; the top controls contain language and theme.

Mobile: Bottom navigation opens Overview, Income, Expenses, and More. **More** groups Expense Mix, data tools, language, appearance, and list display. This avoids a second mobile sidebar.

Mobile bottom navigation and More menu

First step: Import the demo workbook or add income first and expenses next. Monthly buffer, summary cards, ratio, and Expense Mix then update automatically.

Desktop sidebar

ORIENT QUICKLY

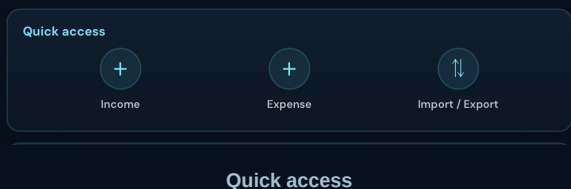

The active navigation is highlighted. Section titles and the chevron in the lists collapse or expand income and expenses.

03 - Dashboard and monthly overview

Monthly buffer: income minus monthly expenses. Green means available; the emphasis changes for a negative result. The bar shows the expense ratio.

Expense Mix: the donut and legend split monthly expenses by category. Summary cards show Income / Month and Expenses / Month. Quick access opens the forms or data tools directly.

COLOR LOGIC

Green: positive and income-related values.
Orange: expenses and emphasis.
Cyan: navigation and actions.
Red: negative buffer or replacement warning.

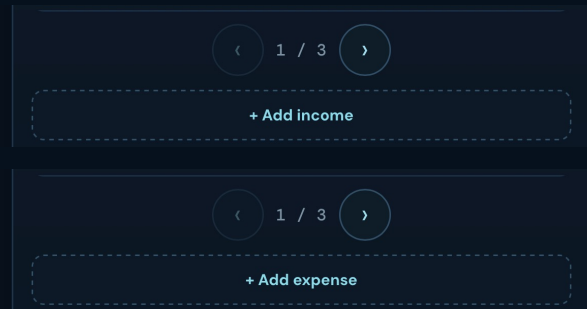

04 - Income, expenses, and Quick access

MANAGE ENTRIES

Add: + Add income and + Add expense open a form. Enter icon, name, and amount; expenses also have a frequency.

Edit and delete: The pencil icon edits an existing item inline. X deletes it; mobile also supports swipe-to-delete. Undo appears briefly afterwards.

Frequencies: Monthly, Every 2 months, Quarterly, Yearly, and Variable. For non-monthly expenses, the payment amount stays visible while buffer and charts use the monthly budget equivalent.

Adding income and expenses

Pagination: When there are more entries than the chosen count, round arrows and a display such as 1 / 3 appear. Income and expenses keep separate page sizes.

Desktop lists: Both lists show the current page, an add button, and the monthly total.

05 - More menu and settings

MORE

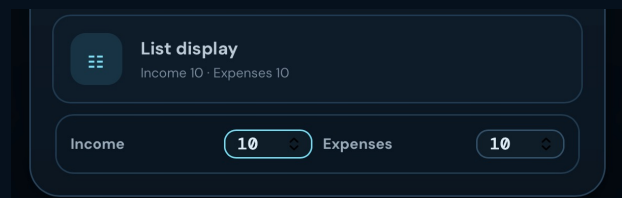

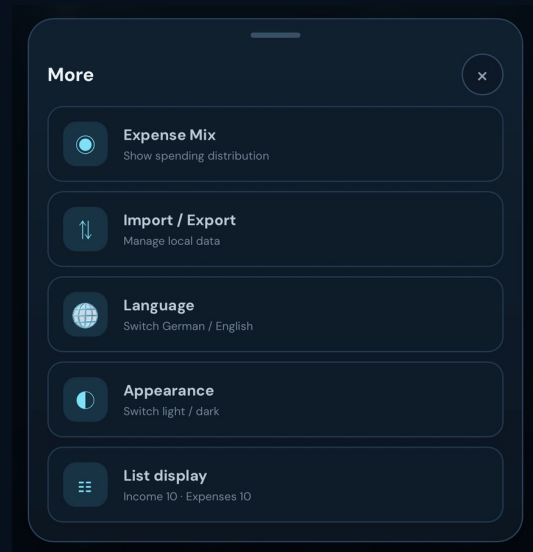

Expense Mix: jumps to the graphical spending distribution.

Import / Export: opens the six data actions.

Language: switches German and English; all visible labels adapt.

Appearance: switches light/dark.

List display: choose 10, 15, 20, or 25 entries per page separately for income and expenses. The choice is stored locally and included in JSON backup.

More menu with list display

Settings persist: Language, theme, collapsed sections, and the selected list display are stored in the browser. JSON backup preserves these settings together with budget data.

06 - Import, export, and backup

Import Excel: reads .xlsx or .xls. A preview lists recognized income, expenses, and invalid rows; only then do you apply the import.

Export Excel: creates a workbook with entries, monthly values, and shares.

PDF: opens a printable monthly overview. **PNG:** exports the dashboard area as an image.

JSON backup: stores budget data and settings. **Restore JSON:** shows a preview before replacement. Cancel keeps existing local data unchanged.

Important: A JSON restore replaces current local data. Export a current JSON backup first if you need a rollback point.

07 - Demo data, offline use, and privacy

DATENSCHUTZ / PRIVACY

Demo workbook: All screenshots in this guide show fictional values from **docs/examples/demo.xlsx**, the demo Excel workbook in the GitHub repository. It is safe for trying the Excel import.

Stored locally: Budget data lives exclusively in browser storage (localStorage). There is no backend, user account, tracking, or server-side storage of personal financial data.

Offline PWA: A Service Worker caches the static app for offline use. After loading, BudgetAtlas can be installed on mobile and desktop. An update notice can appear when a newer version.json is detected.

Motion: the interface respects prefers-reduced-motion.

NO ACCOUNTS

No sign-in and no user accounts.

NO SERVER BUDGET

No server-side storage of budget data.

NO TRACKING

The project documentation describes no tracking.

NO INVENTED MODULES

No accounts, goals, receipt scanner, or artificial budgets.

08 - Typical workflows

1 - SET UP A MONTH

Add income, add expenses with the appropriate frequency, then check buffer, ratio, and mix.

2 - QUICK ENTRY

Use Quick access, add income or expense, and save. Monthly values update immediately.

3 - REVIEW

Open Expense Mix, collapse or expand lists, and change page size or page for long lists.

4 - BACK UP OR EXPORT

Use JSON for a full backup; Excel for tables, PDF for a report, and PNG for the dashboard view.

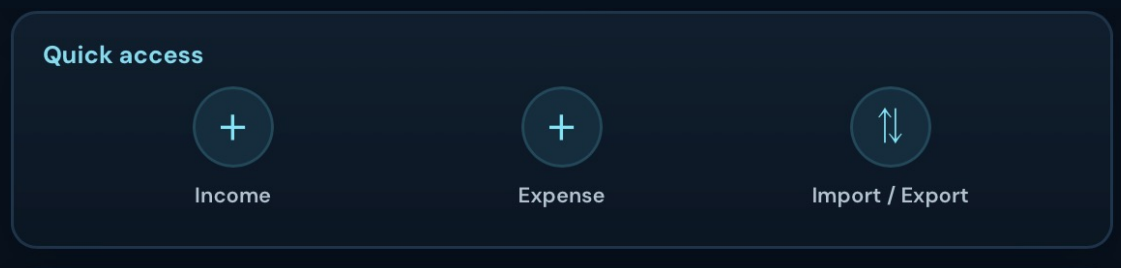

REFERENCE

Project: BudgetAtlas v1.1

Live app: schrotty74.github.io/BudgetAtlas

Repository: github.com/Schrotty74/BudgetAtlas

This guide is a user guide, not financial advice.

Quick access: Income, expense, and Import / Export are the three direct actions on Overview.
